

# InviroPac™ Distributed Systems

Leading the Way in Distributed Refrigeration Systems.

## HPIP

Narrow Horizontal Unit

### InviroPac Advantages

InviroPac™ from Hillphoenix® is a packaged, indoor distributed refrigeration system and is available in horizontal and vertical configurations. InviroPac is engineered with up to 8 reciprocating or scroll compressors in the horizontal unit and 4 reciprocating or 6 scroll compressors in the vertical unit. Both units are available with loop piping, stubs and discharge and liquid components mounted inside the cabinet. These unique designs allow our application experts the ability to custom engineer your InviroPac to match a wide range of refrigeration requirements. Using InviroPac will require fewer units per store when compared to competitive offerings and uses a lower refrigerant charge when compared to central rack systems. It is ideally suited for locations inside the backroom.

Standard Vertical Unit

### Flexibility

The bottom line is that InviroPac can be equipped in almost any way necessary to meet your stores specific requirements.

### Easy Installation

InviroPac units can be mounted in a variety of locations. Horizontal units are ideal for mounting on top of refrigerated walk-in boxes, while the vertical unit is well-suited for setting on the floor in your backroom. InviroPac units can be provided to handle all of your case electrical needs. All that is needed to install the InviroPac in your store is to simply mount in place and connect to your store's piping and wiring. InviroPac is ready to go almost immediately.
